

## Delivering value: The continuing convergence between AV and IT

### Kristian Glahn, Senior AV Specialist

Talks about the convergence between AV and IT has gone on for years on multiple levels. In reality a convergence has already happened on several planes and future AV systems will not only rely on the network for signal distribution and control, but also be dependent on utilizing data from building automation systems, IoT devices and cloud data to deliver the intelligence and value expected from AV systems of tomorrow. In this session we will take a look at the future role of different networks and the use of IoT and sensor data and AI in future AV systems.
